Novel isolated nucleic acid derived from Nicotiana benthamiana, Oryzae sativa, Saccharomyces cerevisiae, and Papaver rhoeas, useful for conferring altered visual phenotypes in plants.

Claim 1; SEQ ID NO 1848; 517pp; English.

This invention relates to the identification and isolation of novel nucleic acid molecules that confer altered visual phenotypes in plants. Specifically, it refers to modifications of plant architecture and/ or leaf surface features in plants, such as chlorotic, bleaching, etching, wet leaf, stunting, elongation and texture phenotypes, which are thought will be agronomic traits beneficial to the farmer. As such, these novel phenotypes can affect growth regulation i.e. useful for creating dwarf varieties, exhibit resistance to insects or heat stress, confer changes in pigment content such that plants have enhanced vitamin production or delayed senescence and also for example produce plants that control the production of ethylene. Purthermore, the present invention comprises generating transgenic plants, as well as reproducibly altering the visual phenotype of plant seeds, plant tissues and plant cells containing the polynucleotides described herein. This polynucleotide is a homologue of a DNA sequence that confers an altered visual phenotype when expressed in plants, the method of the invention.

/note="vector: pHOS1; Site:" BRE 1; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The V + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

Based upon the presence of a XhoI site followed by a run of 14 or
more T residues at the beginning of the sequence, this clone was
polyadenylated. The resulting Poly-T sequence has been removed. hit

Based upon the presence of a XhoI site followed by a run of 14 or

moreT residues at the beginning of the sequence, this clone was

polyadenylated. The resulting Poly-T sequence has been removed. hit

for bioremedia acid sequence.

Claim 1; Fig 22; 102pp; English.

The present invention relates to bioremediative microorganisms comprising 16S ribosomal subunit nucleic acid sequence. The microorganisms of the invention are useful for dechlorinating polychlorinated biphenyls (PCBs) including anaerobic dechlorination of ottho- and double-flanked chloro substituents of PCBs. They are useful for biodegradation of halogenated corganic waste, e.g., contaminated soil from landfill sites and river beds containing PCBs and to treat leachasts and aqueous surfactant solutions resulting from washing the organic waste to transfer PCBs to the aqueous surfactant solutions. The method of the invention is useful for

Dehalococcoides related family A 16S DHFA sequence. 16S rDNA, dechlorinating bacterial organism; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Intergenic spacer; Chlamydiaceae; 168 rRNA; 238 rRNA; Region A; Region B; chlamydial infection; ss.
                                                                                        The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which
                                                                                                                                                                                                                                                         involves contacting a chlorinated compound with the organism. Oligomuclectide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is Dehalococcoides related family A 165 DHFA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Intergenic spacer between 168 and 23S rRNA genes of strain FML-12.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from Chlamydiaceae. The sequences comprise the intergenic spacer between the 16S and the 23S rRNA genes, including the far downstream end of the 16S and the far upstream end of the 23S and the far upstream end of the 23S and the far upstream end of the 23S and of Domain I (referred to as Region A), and secondarily, a 131 bp region in the 3' end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are probes can be used to identify the presence of Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for diagnosing chlamydial infections in humans and animals. ```
from Chlamydiaceae. The sequences comparise the intergenic spacer between the 16S and the 23S rRNA genes, including the far downstream end of the 16S and the far upstream end of the 23S domain I flanking intergenic spacer (referred to as Region A), and secondarily, a 131 bp region in the 3' end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are useful for identifying and detecting chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for disanosing chlamydial infections in humans and animals. AAH28371-AAH28413 represent intergenic spacer target sequences, derived from Chlamydiaceae. The sequences comprise the intergenic spacer between the 16S and the 23s rNAM genes, including the far downstream end of the 16S and the far upstream end of the 23S domain I flanking intergenic spacer (referred to as Region A), and secondarily, a 131 bp region in the 3' end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are useful for identifying and detecting Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for diagnosing chlamydial infections in humans and animals. AAH28171-AAH28413 represent intergenic spacer target sequences, derived from Chlamydiaceae. The sequences comprise the intergenic spacer between the 16S and the 23S rRNA genes, including the far downstream end of the 16S and the far upstream end of the 23S domain I flanking intergenic spacer (referred to as Region A), and secondarily, a 131 bp region in the 3' end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are useful for identifying and detecting Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for diagnosing chlamydial infections in humans and animals. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                     Intergenic spacer, Chlamydiaceae, 16S rRNA; 23S rRNA; Region A; Region B; chlamydial infection; ss.
                                                                                                                                                                           Intergenic spacer between 16S and 23S rRNA genes of strain CWL-1011.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New primers and probes derived from sequences of intergenic spacer between 16S and 23S genes and region of Domain I in 23S region of Chlamydiaceae, useful for assaying and identifying all strains of Chlamydiaceae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           23S rRNA"

The 16S rDNA profile is linked to dechlorinating activity. Bacterial strain comprising the 16S rDNA sequence of the invention are useful for the dechlorination of chlorinated compounds such as carbontetrachloride, tetrachloroethane, chloride, and chloromethane, trichhoroethane, dichloroethylene, viryl chloride, and chloroaromatics. The 16S rDNA sequence is also useful for identification of new chlorinating bacteria, as well as sub-typing strains of Dehalococcoides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the 16S rDNA profile of Dehalococcoides
spacer (referred to as Region.A), and secondarily, a 131 bp region in t 3 end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are useful for identifying and detecting Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for diagnosing chlamydial infections in humans and animals.                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism that is involves contacting a chlorinating chlorinated compounds which involves contacting a chlorinated compound with the organism. Oligonucleotide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating to useful for identifying dechlorinating useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism that is a involves contacting a chlorinating chlorinated compounds which involves contacting a chlorinated compound with the organism. Oligonuclectide polymer of the invention is useful for separating collinating chlorinating chlorinating subfamilites of dechlorinating bacterial organism. The present sequence is

The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which involves contracting a chlorinated compound with the organism. Oligonuclectide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is

The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which involves contacting a chlorinating chlorinated compounds which oligonucleotide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is Dehalococcoides ethenogenes 16S rDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated 16S rDNA sequence useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present sequence represents the 16S rDNA profile of Dehalococcoides ethenogenes strain 195. The 16S rDNA profile is linked to dechlorinating activity. Bacterial strain comprising the 16S rDNA sequence of the invention are useful for the dechlorination of chlorinated compounds such as carbontetrachloride, tetrachlorocthane, chloroform, dichloromethane, trichlorocethane, dichlorocethylene, vinyl chloride, and chloroacomatics. The 16S rDNA sequence is also useful for identification of new chlorinating bacteria, as well as sub-typing strains of Dehalococcoides
                                                                                                                      16S rDNA; dechlorinating activity; chlorinated compound; vinyl chloride; carbontetrachloride; tetrachloroethane; chloroform; dichloromethane; trichloroethane; dichloroethylene; chlorinating bacteria; ss.
                                                                                     A 16S rDNA sequence indicative of a chlorinating bacterial strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New 16S rDNA profile derived from Dehalococcoides ethenogenes and indicative of a dechlorinating bacterial strain.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 25, Sequence 35, Sequence 67, Sequence 68, Sequence 68, Sequence 37, A

Sequence 2320, Application US/09328352

Patent No. £56258.

GENERAL INFORMATION:

APPLICANT: GARY L. Breton et al.

TITLE OF INVENTION: BUTCHOL AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER

TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS

FILE REPERENCE: GTC99-03PA

CURRENT PELLIAGIATION WHBER: US/09/328,352

CURRENT FILING DATE: 1999-06-04

NUMBER OF SEQ ID NOS: 8252

LENGTH: 684

TYPE: DNA

Patent No. 6653118
GENERAL INFORMATION:
APPLICANT: Tanuma, Sei-ichi
APPLICANT: Tanuma, Sei-ichi
APPLICANT: Tanuma, Sei-ichi
APPLICANT: Shiokawa, Daisuke
TITLE OF INVENTION: No. 6653118el Deoxyribonuclease, Gene Encoding Thereof and Use Th
TITLE OF INVENTION: No. 6653118el Deoxyribonuclease, Gene Encoding Thereof and Use Th
TITLE OF INVENTION: NOWBER: US/09/807,784B
CURRENT FILING DATE: 1999-08-17
NUMBER OF APPLICATION NUMBER: UP 11-230870
PRIOR FILING DATE: 1999-08-17
NUMBER OF SEQ ID NOS: 15
LENGTH: 32
TYPE: DNA
CORGANISM: Artificial Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ; LOCATION: (1117); OTHER INFORMATION: Identity of nuclectide at the above locations are unknown.

Two adult female worms of Onchocerca volvulus were isolated from consenting patients and quick frozen. Adult female mRNA was converted to double-stranded CDNA using reverse was converted. to double-stranded by RNase H and DNA pol I. The library has 7 x 10E5 independent recombinants and the average insert size is x=100Dp.The library was constructed by Michelle Lizotte-Waniewski with worms provided by Dr. Sara Lustigman. The library is available
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Onchocerca volvulus

/clone="conservation of the properties of the
analysis were selected following oligonuclectide hybridization fingerprinting of arrayed clones from zebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
